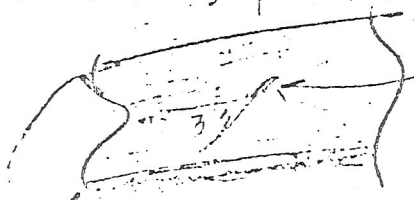
C321

Q609 Piece of curbing



Specimens submitted for examination

Barely discernable smearing of - no groove or visible dep. No comp. part. Low R - not pristine but not.

Request for location and examination of mark on curbing at assassination site

Curb -- Minor disturbance at L to edge. If - if lead - entering present it could have originated from a [illegible] jacketed bullet - such as C 1, 2, 3, a automatic wheel balancing weight or some other source of lead. The absence of copper - alloy bullet jacket residue precludes the possibility that the mark was made by an unmutilated fired metal jacketed bullet. Further the damage to the curbing would have been much more extensive if a rifle bullet such as C 1 - 3 had struck the curb without penetrating some object

2-FBI, Dallas (100-10461)

NC 81827 CE, Bl

is curbing to which the piece designated Q 321. was removed on 8-5-64 and is now in the FBI lab. has been in the FBI laboratory.

Small foreign metal smears were found adhering to the curbing section at an area which bears a mark. These metal smears were spectrographically determined to be essentially lead with a trace of antimony. No copper was found.

The lead could have originated from a lead bullet, the lead core of a metal jacketed bullet such as the type of bullet ~~such as C3 or some other source~~ used in 6.5 mm Mannlicher-Carcano cartridges of this type or from some other source having the same composition.

The above absence of copper precludes the possibility that the mark on the curbing section was made by an unmutilated full jacket military type full metal jacketed bullet such as the bullet recovered from Governor Connally's stretcher ~~(C-2)~~ or the bullet or bullets represented by the jacket fragments, C2 and C3, found in the Presidential limousine. Further, the damage to the curbing would have been much more extensive if a rifle bullet had struck the curbing without first having struck some other object.
